

**Documentation of statistics for
Productivity 2014**

1 Introduction

The purpose of the statistics is to calculate the growth in labor productivity and to detect what causes this growth. Labor Productivity is an important component in the analysis of the economy. In 2003 the labor accounts on employment and hours was incorporated in the national accounts. Since then it has been possible to calculate the growth in labor productivity (and the causes) back to 1966.

2 Statistical presentation

Productivity is basically a measure of how efficiently you use your resources (labor, capital, etc.) when producing goods and services. By using a method based on a production function and other assumptions it is possible to determine the causes of labor productivity. With the KLEMS method you can equivalently determine the causes of output productivity (output per hour worked).

2.1 Data description

Labor productivity (LP) is defined as the real value of GDP at factor cost per hour worked. The calculations are based on figures from market activity. In the statistic "Productivity" the growth in LP is derived from contributions from four sources: It capital deepening (It capital per hour worked) Non-it capital deepening Educational level Total factor productivity (TFP)

The method used in the statistic is based on Jorgenson et al. (2002), "Growth of U.S. Industries and Investments in Information Technology and Higher Education", and OECD (2001), "Measuring productivity. Measurement of aggregate and industry-level productivity growth".

In November 2010 the statistic was supplemented with the so called KLEMS method. The productivity measurement for this method is output (excl. other taxes less subsidies on production) per hours worked. The KLEMS method calculates the contributions from K, L, E, M and S (Capital, Labor and intermediate consumption of Energy, Materials and Services). After the publication of figures for 2013 the production of the KLEMS statistics has been put on hold.

2.2 Classification system

Statistics Denmark's industrial classification DBO7, which is a Danish version of the EU NACE, rev. 2. and the UN's ISIC, rev. 4, contains a number of standard classifications: the 127, 36, 19, and 10 classifications.

Productivity is calculated from national accounts figures. The national accounts classification of 117 industries corresponds - with few deviations - to the 127 standard classification and the 117 industries of the national accounts can be aggregated to the other standard classifications. For this reason, productivity figures can easily be compared to and used in connection with other statistics that are based on the DBO7-standard classifications.

Internationally there is a high degree of comparability with the productivity figures of other countries because the Danish productivity figures is compiled in accordance with the definitions in the European System of National Accounts ESA2010.

2.3 Sector coverage

All industries according to Danish Industrial Classification of All Economic Activities 2007 (DBO7).

2.4 Statistical concepts and definitions

Arbejdsproduktivitet (BFI pr. time): Beregnes som den reale bruttofaktorindkomst (BFI) i kædede 2010-priser pr. arbejdstime. Alle beregningerne er baseret på tal for den markedsræssige økonomi, dvs. hele økonomien eksklusive sektorerne "Offentlig forvaltning og service" (S.13) og NPISH (S.15). NPISH er en forkortelse for Non Profit Institutions Serving Households.

Output-produktivitet (produktionsværdi pr. time): Defineres her som den kædede værdi af output divideret med antallet af arbejdstimer. Output er her defineret som produktionsværdi minus andre produktionsskatter, netto. Alle beregningerne er baseret på tal for den markedsræssige økonomi, dvs. hele økonomien eksklusive sektorerne "Offentlig forvaltning og service" (S.13) og NPISH (S.15).

It-kapital: består af:

- IT-udstyr
- Telekommunikationsudstyr
- Computer software

Anden kapital: udgøres af:

- Boliger
- Andre bygninger
- Anlæg
- Transportmidler
- Maskiner og inventar ekskl. It-kapital (se definition ovenfor)
- Militære våbensystemer
- Stambesætninger mv.
- Forskning og udvikling
- Olie, gas, mineral efterforskning
- Originalværker indenfor kunst og underholdning mv.

arbejdskraftkvalitet: Et indeks for arbejdskraftkvalitet er forholdet mellem et indeks for arbejdskraftydelse (kvalitetskorrigeret, dvs. kvalitets- og mængdeændringer i antallet af arbejdstimer indeholdt i samme indeks) og et indeks for det simple antal arbejdstimer (dvs. mængdeændringen i antallet af arbejdstimer). Arbejdskraftkvalitet er som sådant et udtryk for ændringer i selve kvaliteten af arbejdstimerne, hvilket også benævnes en sammensætningseffekt. Da indekset for arbejdskraftkvalitet i denne statistik kun tager højde for uddannelse benævnes det fremover uddannelsesniveau. Det kvalitetskorrigerede indeks bygger på arbejdstimer fordelt på fem uddannelsesgrupper:

- Grundskoleuddannelse
- Erhvervsfaglig uddannelse
- Kort videregående uddannelse
- Mellemlang videregående uddannelse
- Lang videregående uddannelse

2.5 Statistical unit

For the compilation of output, intermediate consumption, taxes linked to production and subsidies, wages and salaries, employment, fixed capital formation and depreciation, the statistical unit is the local kind-of-activity unit. For the compilation of distributive and financial transactions, which cannot be divided up unambiguously among the individual kind-of-activity units belonging to a decision making unit (enterprise), the unit is the larger institutional unit, which in most cases will be the same as the legal unit which is the enterprise.

2.6 Statistical population

All units generating Danish economic activity.

2.7 Reference area

Denmark.

2.8 Time coverage

1966-2014 for Labor Productivity (the last year will appear in the name of the publication). 1966-2014 for Productivity (the last year will appear in the name of the publication).

2.9 Base period

GDP at factor cost is compiled as chain volume indices (chained values) with 2010 as base year. This is an attempt to isolate the volume part of the monetary values.

2.10 Unit of measure

Percent and index.

2.11 Reference period

1966 - 2014

2.12 Frequency of dissemination

Annually.

2.13 Legal acts and other agreements

Act on Statistics Denmark § 6 and §§ 8 - 12.

Council Regulation (EU) No 549/2013 of May 21 2013 on the European system of national and regional accounts in the European Union (ESA2010) (OJ L 174 26.06.2013, p. 1).

2.14 Cost and burden

There is no direct burden of response since data are collected for other purposes.

2.15 Comment

For a theoretical background and methods for deriving growth of productivity: "Growth of U.S. Industries and Investments in Information Technology and Higher Education", Jorgenson, D.W., Ho, M.S. and Stiroh, K. J. 2002 and "Measurement of aggregate and industry-level productivity growth", OECD 2001. The later can be downloaded from OECD's homepage: www.oecd.org

3 Statistical processing

Labor productivity is defined as the real value of GDP at factor cost per hour worked. The calculations are based on figures from market activity from national accounts, i.e. the total economy excluding the sectors: General government (S.13) and NPISH (S.15). The sources used for calculating the productivity growth is fixed capital, Labor force education statistics and sector account figures for GDP at factor cost and hours worked.

3.1 Source data

The sources used for calculating labor productivity (LP) are sector figures from the national accounts on GDP at factor cost and hours worked.

The sources used for calculating the productivity growth (the causes of LP) is the above, fixed capital and statistics of education. For the computation of KLEMS we use data from the input-output tables to split intermediate consumption into energy, materials and services.

3.2 Frequency of data collection

Annual.

3.3 Data collection

Not relevant for this statistics.

3.4 Data validation

The sources for the statistic have been published before they are received and therefore they have already been validated. When the sources are received they are compared to the numbers already published.

3.5 Data compilation

The data compilation is conducted on the most detailed level. Labor productivity is computed by 117 industries and Productivity is computed by 69 industries. Labor productivity is defined as the real value of GDP at factor cost per hour worked. The calculations are based on figures from market activity from national accounts, i.e. the total economy excluding the sectors: General government (S.13) and NPISH (S.15). The Total is however based on figures for the total economy.

The growth in Labor productivity is derived from contributions from four sources: · It-capital deepening (computed with figures from the capital stock) · Non-it capital deepening (computed with figures from the capital stock) · Educational level (computed with figures from labor force education statistics) · Total factor productivity (computed residually when Labor productivity and the three above numbers are computed)

The KLEMS method is based on output per hour worked and is therefore derived from contributions from the above four sources (calculated in another way than by the GDP-method above) and the three sources below (computed with figures from the input-output tables): · Intermediate consumption of Energy · Intermediate consumption of Materials · Intermediate consumption of Services

3.6 Adjustment

Normally no corrections to data are made.

4 Relevance

The national accounts (including Productivity statistics) constitute core indicators of the analyses of economic growth. Users are primary researchers, economic departments and organizations.

The division of national accounts continuously evaluates feedback from our users.

4.1 User Needs

Labor Productivity is published separate and as a part of the publication "productivity". Both publications constitute core indicators of the analyses of economic growth. Users are primary researchers, economic departments and organizations.

4.2 User Satisfaction

The division of national accounts continuously evaluates feedback from our users.

4.3 Data completeness rate

This statistic is not mentioned in any regulations etc. Data for this statistic is primarily from other publications in the national accounts. These publications are all covered by EU regulations.

5 Accuracy and reliability

The uncertainty on productivity growth (including the Labor productivity) is closely related to the uncertainty on the figures used from the national accounts. In addition, there is uncertainty connected with the assumptions made, for example in relation to production functions and their assumptions.

No traditional measure of the error margins for the variables described by the statistic is available. In principle such a measure is not possible.

5.1 Overall accuracy

The inaccuracy of this statistic relates to the inaccuracy of the figures used from the national accounts. See documentation of statistics for Annual national accounts.

5.2 Sampling error

Not relevant for these statistics.

5.3 Non-sampling error

The inaccuracy of this statistic relates to the inaccuracy of the figures used from the national accounts. See documentation of statistics for Annual national accounts.

5.4 Quality management

Statistics Denmark follows the recommendations on organisation and management of quality given in the Code of Practice for European Statistics (CoP) and the implementation guidelines given in the Quality Assurance Framework of the European Statistical System (QAF). A Working Group on Quality and a central quality assurance function have been established to continuously carry through control of products and processes.

5.5 Quality assurance

Statistics Denmark follows the principles in the Code of Practice for European Statistics (CoP) and uses the Quality Assurance Framework of the European Statistical System (QAF) for the implementation of the principles. This involves continuous decentralized and central control of products and processes based on documentation following international standards. The central quality assurance function reports to the Working Group on Quality. Reports include suggestions for improvement that are assessed, decided and subsequently implemented.

5.6 Quality assessment

This statistic is based on the Danish national accounts.

When the national accounts were based on the definitions in the European System of National Accounts ESA2010, the national accounts were at the same time undergoing a major revision, which means that all the levels were examined and evaluated, among other things for the sake of the Gross National Income compilations, which form the basis of a considerable amount of the financial contribution from Denmark to the EU.

A reasonable accuracy of the national accounts figures is maintained by compiling the product balances at a very detailed level. Furthermore, the compilation of the central variable GDP is to the greatest extent possible compiled from the point of view: production, expenditure and income.

5.7 Data revision - policy

Statistics Denmark revises published figures in accordance with the [Revision Policy for Statistics Denmark](#). The common procedures and principles of the Revision Policy are for some statistics supplemented by a specific revision practice.

5.8 Data revision practice

Labor productivity is consistent with the rest of the national account. By the end of the year national accounts figures from year minus 3 are declared final. Thus the figures from 2011 was declared final in December 2014.

6 Timeliness and punctuality

First version of preliminary yearly national accounts (NA) figures are published end of March the following year. First version of Labor productivity (LP) for that year is published in May. The final figures for NA are published in November 3 years after the reference year. The final version of LP for that year is published in December. In February/March Productivity growth (Total factor productivity, KLEMS etc.) is published. The productivity statistics are usually published according to schedule.

6.1 Timeliness and time lag - final results

First version of preliminary yearly national accounts (NA) figures are published end of March the following year. First version of Labor productivity (LP) for that year is published in May. The final figures for NA are published in November 3 years after the reference year. The final version of LP for that year is published in December. In February/March Productivity growth (Total factor productivity, KLEMS etc.) is published.

6.2 Punctuality

The productivity statistics are usually published according to schedule.

7 Comparability

This statistic is based on national accounts. Therefore this statistic is consistent with respect to national accounts and comparable over time. Moreover this statistic is comparable to other countries productivity figures if they are also based on ESA2010.

7.1 Comparability - geographical

Internationally there is a high degree of comparability with the national accounts of other countries because the Danish national accounts are compiled in accordance with the definitions in the European System of National Accounts ESA2010.

For all countries the productivity growth (including the Labor productivity) is based on data from the national accounts. Therefore it is possible to compare productivity figures across borders.

7.2 Comparability over time

One of the fundamental goals when compiling national accounts statistics is to achieve a high degree of comparability over time. The statistical sources are therefore adapted in order to be consistent with the concepts of the national accounts. Fundamental changes of nomenclatures as for example classification of industries, changes in definitions as a result of new guidelines as well as new and better sources will inevitably lead to changes in the national accounts and thus in the growth of productivity and its sources. A thorough revision of the data in national accounts was undertaken in the year 2014.

7.3 Coherence - cross domain

Statistics Denmark's industrial classification DBo7, which is a Danish version of the EU NACE, rev. 2. and the UN's ISIC, rev. 4, contains a number of standard classifications: the 127, 36, 19, and 10 classifications.

The final national accounts classification of 117 industries corresponds - with few deviations - to the 127 standard classification and the 117 industries of the national accounts can be aggregated to the other standard classifications. For this reason, national accounts figures can easily be compared to and used in connection with other statistics that are based on the DBo7-standard classifications.

However, comparisons with other statistics at a detailed industry level will often show differences, partly because of differences in definitions of variables, and partly because of the calendar year delimitation of the national accounts and its requirement of total coverage of the economic activity.

7.4 Coherence - internal

There is per se fully internal consistency in the National Accounts.

8 Accessibility and clarity

- [Statbank Denmark](#)
- [News from Statistics Denmark](#)

8.1 Release calendar

The publication date appears in the release calendar. The date is confirmed in the weeks before.

8.2 Release calendar access

The Release Calendar can be accessed on our English website: [Release Calendar](#).

8.3 User access

Statistics are always published at 8:00 a.m. at the day announced in the release calendar. No one outside of Statistics Denmark can access the statistics before they are published.

8.4 News release

See News from statistics Denmark: [Nyt fra Danmarks Statistik - Nationalregnskab og offentlige finanser](#).

8.5 Publications

[Link to Publications](#).

8.6 On-line database

[Tables in Statbank](#).

8.7 Micro-data access

Basic material is stored electronically. In some cases more detailed material can be made available on a service basis at a charge.

8.8 Other

Not relevant for these statistics.

8.9 Confidentiality - policy

Not relevant for these statistics.

8.10 Confidentiality - data treatment

Not relevant for these statistics.

8.11 Documentation on methodology

For a theoretical background and methods for deriving growth of productivity: "Growth of U.S. Industries and Investments in Information Technology and Higher Education", Jorgenson, D.W., Ho, M.S. and Stiroh, K. J. 2002 and "Measurement of aggregate and industry-level productivity growth", OECD 2001. The later can be downloaded from OECD's homepage: www.oecd.org

A detailed description of sources and methods is published in (Danish) the theme publication, *Produktivitetsudviklingen i Danmark. 1966-2003*. Since then part of the method has changed, see the Danish publication *Nyt fra Danmarks Statistik* nr. 430 from 2010. The 3rd of November 2010 the traditional productivity measurement was supplemented by the KLEMS-method, see the Danish publication *Nyt fra Danmarks Statistik* nr.485 from 2010.

8.12 Quality documentation

Results from the quality evaluation of products and selected processes are available in detail for each statistics and in summary reports for the Working Group on Quality.
