

**Documentation of statistics for  
Production and Turnover in Manufacturing Industries 2015  
Month 05**

## 1 Introduction

The main purpose of the monthly industrial production and turnover statistics is to provide up-to date short-term information on the business cycle.

## 2 Statistical presentation

The statistic provides a monthly estimate of the development in industrial production. Furthermore it shows the development in turnover, divided by domestic market and by export market.

### 2.1 Data description

The statistic provides a monthly estimate of the development in industrial production. Furthermore it shows the development in turnover, divided by domestic market and by export market. The production as well as the turnover figures are published on detailed levels of activity and the figures are seasonally adjusted.

### 2.2 Classification system

The industry coding follows the Danish industrial classifications, Dansk Branchekode 2007 (DB07), which is the national version of NACE rev. 2. A complete overview can be found at the DB07 site. Data is moreover divided on 4 main industrial groupings. An overview of this grouping can be found in this [attachment \(in Danish\)](#).

### 2.3 Sector coverage

Manufacturing, mining and quarrying, and utility services.

### 2.4 Statistical concepts and definitions

**Export:** Export turnover is defined as deliveries to recipients outside the Danish Customs area, the Faroe Islands and Greenland.

**Domestic Market:** Domestic turnover is defined as deliveries to recipients in Danish Customs area and the drilling platforms in The North Sea.

**Turnover:** Turnover is valued in current prices. Defined as invoiced values excluding value added tax and indirect taxes, but including subsidies such as e.g. price subsidies. Invoiced rebates are deducted. Turnover includes sales of manufactured goods, hours worked to third parties and mounting, installations and repairs. Sales of goods purchased for resale in the same condition as received is not included. Neither is secondary income such as e.g. sales of know-how and leases for own production units and machines if used by third parties.

**Production:** The production index, measured in fixed prices, shows the trend in industrial production and provide an up-to date short-term information on the industrial activity. It is calculated on the basis of current turnover, taking into account changes in stocks. There are two categories of stocks involved, stocks of finished goods and stocks of work in progress. The turnover in current prices in a given month is aggregated with the change in stocks values, and the sum is deflated by the corresponding price index. This results in the so called production turnover, which is the basis for production index. For shipbuilding the calculation is based on hours worked instead.

## **2.5 Statistical unit**

The statistical unit is the so-called Kind of Activity Unit (KAU). Most enterprises are identical to one KAU, but some larger enterprises consist of more KAUs each engaged in different activities.

## **2.6 Statistical population**

The population consist, with a few exceptions, of all Kind of Activity Units with at least 20 employees engaged in manufacturing, mining and quarrying, and utility services.

## **2.7 Reference area**

Denmark.

## **2.8 Time coverage**

The statistics covers the period from 2000 and forward. Older time series are described under Comparability over time.

## **2.9 Base period**

The current base year is 2010, changing every five years.

## **2.10 Unit of measure**

The unit of measure is index points.

## **2.11 Reference period**

Turnover is measured as flows of sales or invoiced values during the month. The stocks values, which are used in the production index calculations, are measured by the end of the month. The prices, also used for calculation of production, are referenced in the middle or as an average of the month.

## **2.12 Frequency of dissemination**

The statistics is published monthly.

## **2.13 Legal acts and other agreements**

Law on Statistics Denmark §8 secures the legal ground for collecting the data.

The statistics falls under council regulation (EF) no. 1165/98 of 19 May 1998 og no. 1893/2006 of 20 December 2006 regarding short terms statistics.

## **2.14 Cost and burden**

The burden in 2013 corresponded to 3.235.000 DKK.

## **2.15 Comment**

The Production and turnover in manufacturing industries has a [Subject page](#).

## **3 Statistical processing**

Each month information on turnover and stocks are collected from 1000 manufacturing enterprises in Denmark. The data is error checked and then grossed up to be able to calculate turnover and production figures covering the entire industry. Seasonally adjusted as well as unadjusted data are published.

### **3.1 Source data**

The primary source for the production and turnover statistic is a questionnaire-based survey. For a smaller part of the sample, the data is taken from VAT reports via the statistics on purchases and sales by enterprises. The Producer price index is used for calculation of the production. The source for the grossing up procedure is the quarterly data on turnover in manufacturers' sales of commodities (the Danish Prodcom Statistic). Data for the extraction of crude petroleum and natural gas, which is part of mining and quarrying, and energy supply, both included in the production index originate from the Danish Energy Authority, the net price index and foreign trade statistics. The Statistical Business Register forms the basis for the up-date and revision of the sample of enterprises.

### **3.2 Frequency of data collection**

Data is collected monthly.

### **3.3 Data collection**

Data is collected using an online questionnaire. Online form and instructions can be found on the [information page \(in Danish\)](#).

### **3.4 Data validation**

Data from the individual enterprises are compared to previously reported data from the same enterprises and also compared with other similar enterprises. Moreover, the data are compared to the quarterly statistics on sales in manufacturing industries.

### **3.5 Data compilation**

Data missing because of non-response is imputed using information from previous periods. In the estimation possible sample or non-response bias is corrected by using auxiliary information from the quarterly survey on sales in manufacturing industries. The quarterly statistics covers more enterprises than the monthly survey. The production is calculated by adding monthly changes in stock value to the monthly turnover and dividing the result by a corresponding price index. This results in the monthly produced volume which is the basis for the production index. In the calculation of aggregated production indices, the detailed industry figures are weighted using value added.

### **3.6 Adjustment**

The figures are seasonally adjusted on the lowest level of publication. Indirect seasonal adjustment are used for calculating seasonal adjusted figures on a more aggregated level.

## **4 Relevance**

The primary users of the statistics are various industrial organisations, the financial sector, politicians, public authorities, private organisations, international organisations and the news media. The indicators are used for business cycle analysis. The statistic also provide specific information regarding the domestic market and the export market.

### **4.1 User Needs**

The primary users of the statistics are various industrial organisations, the financial sector, politicians, public authorities, private organisations, international organisations and the news media. The indicators are used for business cycle analysis. The statistic also provide specific information regarding the domestic market and the export market.

### **4.2 User Satisfaction**

Twice a year meetings with important users are held. At these meetings the users are given opportunity to give information about their use of the published figures, and they are informed about important actual themes in the statistics.

### **4.3 Data completeness rate**

This statistics is affected by demands from EU. In terms of completeness all these demands are fully met.

## **5 Accuracy and reliability**

The main focus of the published figures is on the recent development of the monthly production. In general these figures are reasonably precise and reliable, but a few reservations must be made: First of all the calculation of the production relies heavily on coherence between the reported turnover and stock figures and the price indices used for volume calculations. At times this weakens the precision. Secondly, the calculations use information from the quarterly survey on sales in manufacturing industries, and once a quarter this can lead to relatively large revisions to the figures of the recent months.

### **5.1 Overall accuracy**

The total error on the total production is normally less than 2 pct.. Around half of this error is a sample error while the remaining half is caused by nonsampling-errors such as measurement errors and model assumptions. Especially the volume calculations, where the turnover and stock values are deflated, adds to the non-sampling errors. This does not affect the turnover indices and the error on the turnover figures will normally be below 1.5 pct.

The accuracy on the monthly growth rates is in general somewhat better, normally with an error less than half the errors on the actual figures.

### **5.2 Sampling error**

Less than 1 pct. on the total production and turnover figures.

### **5.3 Non-sampling error**

Coverage errors do not affect the accuracy in any significant way, because of a very thorough quality assurance of the population used for grossing up the survey data. Measurement errors on the reported figures on turnover and stocks is not an important issue, but lack of consistency with the price indices used for deflation can in some cases affect the accuracy. Non-response does not add much to the error, because information from the quarterly survey on sales in manufacturing industries, which covers the entire population, is included in the estimation to compensate for any bias in the non-response. In the calculation of the production changes in the stock values are included in the turnover to be deflated. By using that method it is assumed that the prices of sold goods develop similar to the prices of the stocked goods. This is not always true.

### **5.4 Quality management**

Statistics Denmark follows the recommendations on organisation and management of quality given in the Code of Practice for European Statistics (CoP) and the implementation guidelines given in the Quality Assurance Framework of the European Statistical System (QAF). A Working Group on Quality and a central quality assurance function have been established to continuously carry through control of products and processes.

## **5.5 Quality assurance**

Statistics Denmark follows the principles in the Code of Practice for European Statistics (CoP) and uses the Quality Assurance Framework of the European Statistical System (QAF) for the implementation of the principles. This involves continuous decentralized and central control of products and processes based on documentation following international standards. The central quality assurance function reports to the Working Group on Quality. Reports include suggestions for improvement that are assessed, decided and subsequently implemented.

## **5.6 Quality assessment**

The overall quality of the statistics is good. It provides a good estimate of the recent development in the production and turnover in the manufacturing industries.

The main focus of the published figures is on the recent development of the monthly production. In general these figures are reasonably precise and reliable, but a few reservations must be made: First of all the calculation of the production relies heavily on coherence between the reported turnover and stock figures and the price indices used for volume calculations. At times this weakens the precision. Secondly, the calculations use information from the quarterly survey on sales in manufacturing industries, and once a quarter this can lead to relatively large revisions to the figures of the recent months.

## **5.7 Data revision - policy**

Statistics Denmark revises published figures in accordance with the [Revision Policy for Statistics Denmark](#). The common procedures and principles of the Revision Policy are for some statistics supplemented by a specific revision practice.

## **5.8 Data revision practice**

The monthly figures are revised twice, and revisions further back in time happen rarely (e.g. with the introduction of new methods). The difference between provisional figures and final figures is normally less than 1 percent. In some cases, however, revisions to information formerly reported by enterprises may lead to differences larger than that.

## **6 Timeliness and punctuality**

The statistics is published between 35 and 40 days after the end of the month. The punctuality is high, with delays happening very rarely.

### **6.1 Timeliness and time lag - final results**

The statistics is published between 35 and 40 days after the end of the month. The first provisional figures are revised with the two next publications, and the final results are thus published after 95-100 days.

### **6.2 Punctuality**

The punctuality is high, with delays happening very rarely.

## **7 Comparability**

The actual time series goes back to year 2000, and it has a high degree of comparability over time. The time series can for most industries be linked to older data, resulting in a comparable time series going back to year 1985. The international comparability with similar statistics from other EU countries is very high.

### **7.1 Comparability - geographical**

The statistics is produced according to common guidelines for all EU countries, ensuring good comparability across the entire EU.

### **7.2 Comparability over time**

With the publication of figures for December 2014 new methods for calculating production were introduced. The entire time series of the production index were recalculated. Until the end of 2012 the name of the statistic was Industrial production and new orders. Before 2005 it was called the Industrial sales and orders statistics. In the Statbank archived tables can be found, including the now discontinued orders variable.

### **7.3 Coherence - cross domain**

With the reservation that there are differences in the statistical concepts, the turnover index is comparable to various other sources in business statistics, notably turnover by activity in the PRODCOM statistic (quarterly), turnover statistics (VAT) in the purchases and sales statistic (monthly), foreign trade statistics (monthly) and accounts statistics (annual).

### **7.4 Coherence - internal**

Seasonal adjustment is performed indirectly, which results in consistency between seasonal adjusted aggregates and their subcomponents. There are no other sources for possible internal inconsistency.

## **8 Accessibility and clarity**

New figures are published in a monthly news article News from Statistics Denmark, and all figures can be found in the [Statbank](#).

The statistics also has a [subject page](#).

### **8.1 Release calendar**

The publication date appears in the release calendar. The date is confirmed in the weeks before.

### **8.2 Release calendar access**

The Release Calendar can be accessed on our English website: [Release Calendar](#).

### **8.3 User access**

Statistics are always published at 9:00 a.m. at the day announced in the release calendar. No one outside of Statistics Denmark can access the statistics before they are published. Theme publications etc. may be published at other times of the day. The National Statistician can decide that such publications may be released before their official publication time, e.g. to the media and other stakeholders.

### **8.4 News release**

The figures are published in a monthly news release, [Nyt from Statistics Denmark](#).

### **8.5 Publications**

The figures are included in [Statistical Yearbook](#).

### **8.6 On-line database**

All figures can be found in the [Statbank](#).

### **8.7 Micro-data access**

There is no micro-data access.

### **8.8 Other**

There is a monthly data deliverance to National accounts as well as international data transmissions to Eurostat and UN.

### **8.9 Confidentiality - policy**

In the compilation of the retail trade index, the confidentiality policy of Statistics Denmark is followed ([link](#), in Danish).

### **8.10 Confidentiality - data treatment**

When figures can not be published on a certain level of detail, because of confidentiality issues, figures are published on a more aggregated level.

### **8.11 Documentation on methodology**

No further methodology papers available.

### **8.12 Quality documentation**

Results from the quality evaluation of products and selected processes are available in detail for each statistics and in summary reports for the Working Group on Quality.

## **9 Contact**

The administrative placement of this statistics is in the division of Short Term Statistics. The person responsible is Søren Kühl Andersen, tel. +45 39 17 35 61, e-mail: ska@dst.dk

### **9.1 Contact organisation**

Statistics Denmark

### **9.2 Contact organisation unit**

Short Term Statistics, Business Statistics

### **9.3 Contact name**

Søren Kühl Andersen

### **9.4 Contact person function**

Responsible for the statistics

### **9.5 Contact mail address**

Sejrøgade 11, 2100 Copenhagen

### **9.6 Contact email address**
