Surveys Department

Topics

- What is the workload allocation system?
- Project stages before workload allocation
- The current situation
- Procedure of workload allocation for each survey
- Demonstration for the Social Survey and the Longitudinal Survey

What is the Workload Allocation System?

- ❖ The workload allocation system allows individuals or households in the sample to be added automatically the interviewer's workloads, before the work is assigned to the interviewers.
- ❖ The workload allocation system provides a geographic display of the distribution of individuals or households in the sample. The display uses 3 layers of information:
 - Roads and streets
 - Locality borders
 - Structures and addresses

What is the Workload Allocation System?

The visual display and use of a geographic allocation system allow the creation of workloads with optimal geographic proximity.

All of the field surveys use this system.

Operational Concepts in Workload Allocation

- **District** An administrative unit that manages the interviewing in defined localities that are usually geographically continuous. The department has 3 districts: Haifa, Tel Aviv and Jerusalem.
- **Supervisor** The manager responsible for the interviewers in a particular enumeration area.
- Domain Enumeration area for which a supervisor is responsible.
- Monthly workload A collection of sample units that an interviewer must cover in a month.
- Yearly workload Work units an interviewer must cover in a survey period. The yearly workload is a collection of monthly workloads.

 Drawing of the sample by the Department of Statistical Methodology

Updating of addresses and derogating deaths

 Anchoring (entering X,Y coordinates) for each record address

 Entering the anchored addresses into the sample database and transferring for workload allocation

4

The Current Situation

Currently, there are 2 workload allocation systems in operation:

- Labour Force Survey, Household Expenditures Survey and Social Survey – this system allows:
 - Allocation of monthly workloads.
 - Creation of a monthly workload in one locality within the district boundaries.

Combination of the monthly workloads into yearly workloads and domains is done manually, outside the system.

The Current Situation

- Longitudinal Survey (and Census)
 - Allocation of monthly workloads
 - Combination of the monthly workloads into yearly workloads
 - Connection of the yearly workloads to domains within the boundaries of each district
 - The system allows creation of a monthly workload in one or more localities within the district boundaries

Procedure of Workload Allocation for the Surveys

Selection of survey and district

Entering parameters into the workload allocation system as a preliminary step

Selecting population type

Selecting work area

Manual allocation

Automatic allocation

Automatic and Manual Allocation

<u>Automatic allocation</u>: Allocation is performed according to geographic proximity and the parameters that were entered into the system.

<u>Manual allocation</u>: Correction of the automatic allocation, if needed. Alternatively, the user can perform this allocation instead of the automatic allocation.

Now we will see how to actually perform the allocation in the system.

❖ After the allocation is done, the data are transferred to the survey management system.

❖ In the survey management system, the district supervisors assign the workloads to the interviewers according to the allocations that were made.

Thank you for your attention, and wishing you a productive and enjoyable discussion!
