Labour market

1. The Danish labour market

Figure 1 Activity rate for 16-66 year-olds 1981-1999 Per cent

More women in the labour market

Labour-market statistics are based on the basic concepts which have been adopted by the International Labour Organisation (ILO). According to these, the population is divided into three groups; the employed and unemployed, which together represent the labour force, and those outside the labour force.

Developments since 1981¹ and up to 1999 show significant differences between men and women in the three groups. The part of the population which is of working age (16-66 year-olds) has increased by 8.2 per cent for men and 6.8 per cent for women. In contrast, the labour force (16-66 year-olds) has risen by 1.6 per cent for men and 10.7 per cent for women. Therefore, there has primarily been an increase in the female part of the labour force. The activity rate is the labour force as a proportion of the total population. The activity rate has fallen steadily for men during the entire period, while the rate for women increased up to 1989, fell from 1990 to 1997, and then began to rise again.

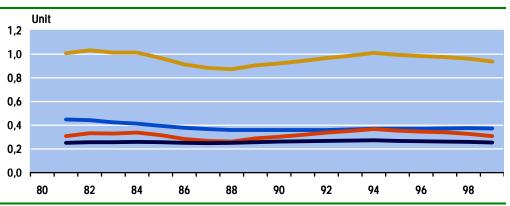

Fewer public-sector employees

Because of privatisation, the number of public-sector employees in central, regional, and local government has fallen (from 743,300 or 29.1 per cent in 1981 to 712,300 or 26.0 per cent in 1999). In 1999 there were twice as many women as men employed in the public sector. From 1981 to 1999, there has been a slight increase in the proportion of women employed in the public sector (64.6 per cent in 1981 compared with 67.7 per cent in 1999).

Figure 2

Dependency ratio 1981-1999

Note. Dependency ratio is calculated as the number of unemployed in each age group divided by the total number of employed persons.

1

Statistical Yearbook 2000

¹ 1981 is the first year register-based labour-force statistics were kept.

The dependency ratio has fallen

If the population is divided into three groups; persons under 16 years-old, unemployed 16-66 year-olds, and persons over 66 years-old, a rough measurement of dependency ratio can be achieved by calculating the number not in employment for each person employed, cf. figure 2.

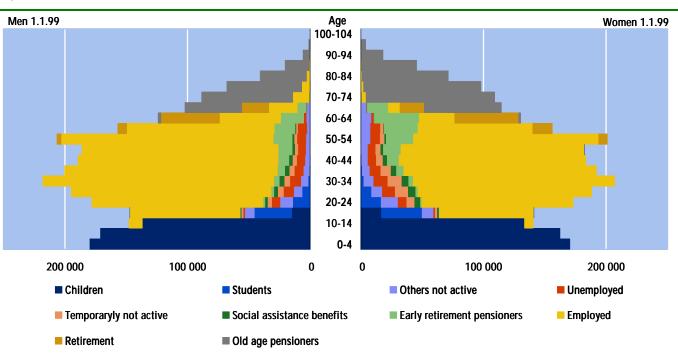

The calculation shows that, overall, the forsøgerbyrden has fallen from 1.01 to 0.94. Whereas, in 1981, 100 persons in employment had to provide for 101 persons not in employment, in 1999 they only had to provide for 94 persons not in employment. This drop in dependency ratio is exclusively due to the fact that there are fewer children, while the number of over 66 year-olds per employed person has remained more or less constant. In recent years, the number not in employment between 16 and 66 has remained the same as in the early 1980s. The curve also follows the changes in unemployment with two peaks in 1983 and 1994.

2. Attachment to the labour market

The life-cycle

An individual's attachment to the labour-market follows a life-cycle which for most people begins after they have finished their education, look for a job, and find their first job. It ends when they retire with a pension. Between these points there are many intermediate phases and combinations. People can be applying for a course of education/training, employed, or unemployed. They can be studying or retired, and at the same time have a part-time job. They can be outside of the labour force temporarily, receive voluntary early retirement pensions, or receive early retirement pay.

Figure 3 Attachment to the labour market 1999

2 Statistical Yearbook 2000

One way of showing the changes in attachment to the labour market is to draw a population pyramid where the distribution of primary attachment to the labour market is shown for each age group. Figure 3 shows such a distribution for both men and women.

The population pyramid shows the attachment to the labour market for each 5-year age group for men and women respectively. The figure shows the two dimensions in the labour market; attachment over the life-cycle, and attachment for each age group.

Voluntary early-retirement pensioners and those temporarily outside the labour force - mostly women

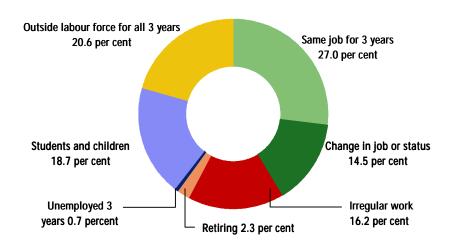

The figure shows some characteristic differences between men and women. There are more men in employment than women, and relatively many men in the 65-84 age group continue in employment, whereas very few women do so.

Between the ages of 15 and 64, there are more women who receive early-retirement pensions or are temporarily outside the labour force. The first point shows that women are more quickly burnt out at work than men. The second is mainly women between 20 and 34 who have temporarily left the labour force, i.e. they are at the age when they have small children to take care of. It is also clear from the figure that many more women than men reach the age of 70 and over.

Flexibility and stability

Examination of the year-to-year changes in attachment to the labour market provides an impression of both flexibility and stability in the labour market. Figure 4 shows the distribution of the entire population on the basis of figures as at 1 January 1996, 1997 and 1998.

Figure 4 Attachment to the labour market over a three-year period

Note. The figure includes all persons who were included in the register-based labour-force statistics in 1996, 1997 and 1998. 216,186 persons or 4.2 per cent were only included in one or two of the three annual analyses. Information regarding changes in job has been retrieved from the integrated database for labour-market statistics - IDA.

Statistical Yearbook 2000 3

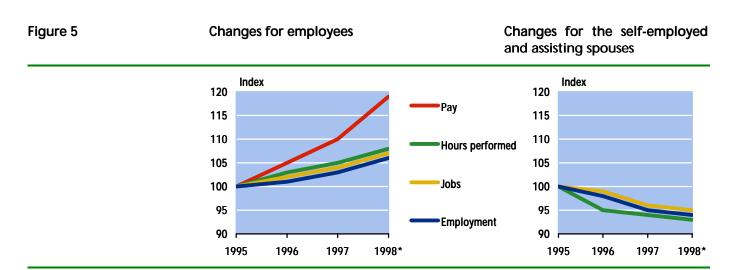

It is clear that about a quarter of the population have had the same job for all three years - either as self employed, an assisting spouse, or as an employee in the same enterprise. 15 per cent have changed job at least once, while 16 per cent have been unemployed or in an activation programme to some degree during the three years. However, this does not include the two per cent who have retired during the period. Moreover, an independent analysis of those who were unemployed for all three years was prepared. In absolute terms, this group comprises 36,000 people.

21 per cent were outside the labour force for the whole period. This group comprises pensioners, people about to retire from the labour market (transitional allowances and early-retirement pay) and recipients of social cash benefits who were not available for the labour market. 19 per cent were students or children throughout the three years. In this regard, however, it is important to note that students who work while they are studying are included as employed in the labour-market statistics.

3. Working hours performed

More working hours performed by employees

Analysis of working hours provides an opportunity to illustrate the changes in the annual number of working hours performed from 1995 onwards. There has been an increase for employees in respect of both number of jobs, employment, and working hours performed, while the figures have dropped since 1995 for the self employed and assisting spouses.

4. Pay and hourly earnings

Total earnings

Pay statistics illustrate what individual employees get out of making their labour available to employers. The main concept in pay statistics is total pay in relation to hours performed, i.e. the hours where employees have been at work.

4 Statistical Yearbook 2000

Figure 6

Hourly earnings for women and men 1998

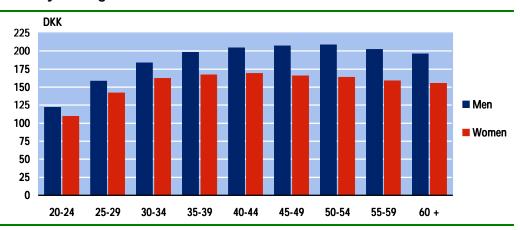

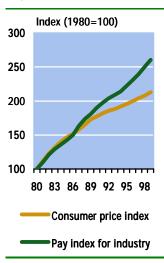

Figure 7 Pay index

Men earn most

Figure 6 shows pay (earnings) in 1998 analysed by sex and age. The figure shows that, irrespective of age, women earn less than men, and that pay is higher for those between 35 and 59 years old than for the young and the elderly. It is important to be careful in drawing concrete conclusions from these statistics, particularly with regard to differences between the sexes. There is a great difference between the types of job men and women occupy within the different age brackets. In general there are more men than women in management positions.

Real pay has increased over the past ten years

Figure 7 shows changes in pay since 1980. In order to illustrate changes in real pay, the figure also shows changes in the consumer price index. In the period up to the late 1980s, pay and prices followed each other. In other words, real pay remained more or less unchanged during the period. From the late 1980s up to the present, pay has increased more rapidly than prices. Thus, this period is characterised by relatively large increases in real pay.

This does not necessarily mean that all employees have experienced such a rapid increase in real pay. In the same period, the structure of the labour market has changed so that today there are relatively more highly educated people than there were 20 years ago. This in itself will affect pay levels and push real pay upwards.

Statistical Yearbook 2000 5

5. Unemployment, labour-market policy measures and voluntary early-retirement pay

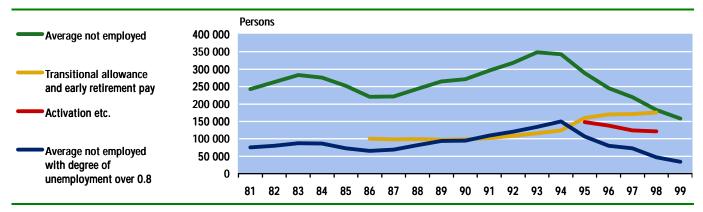

Two periods with increases in employment

Examination of changes in unemployment reveals a curve with two clear peaks. These peaks are in 1983 and 1993-94 between the two recoveries in employment which occurred in the early 1980s and from 1994 onwards. Unemployment has been converted to full man-years.

Figure 8 shows total unemployment, and unemployment for those who have been unemployed for more than 80 per cent of the year. The two curves clearly show the same developments. The drop in unemployment from 1993 to 1999 is dramatic in that it has almost halved from almost 350,000 man-years in 1993 to just less than 160,000 in 1999. Figures for the long-term unemployed have fallen to less than a quarter from 150,000 man-years in 1994 to just under 34,000 in 1999.

Figure 8

Unemployment, transitional allowances, voluntary early-retirement pay, and labour-market policy measures 1981-1999

Large fall in unemployment since 1994

In order to illustrate the area more broadly, the figure shows the changes in the number of people on labour-market policy measures (activation, leave, etc.), and the number on voluntary early retirement (transitional allowances, early-retirement pay). The drop in unemployment from 1994 to 1999 is countered by an increase in the number of people receiving early retirement pay and the number of people in various labour-market policy measures.

However, if the unemployed are added to those on labour-market policy measures and those on transitional allowances or early-retirement pay, from 1995-1998 there is a total drop of 116,300 man-years. This figure is an absolute minimum estimate of the drop in unemployment there would have been if neither labour-market policy measures, nor early-retirement pay had been introduced, in that many would either have found a job or would have been outside the labour force. In other words, they would not all have been unemployed.

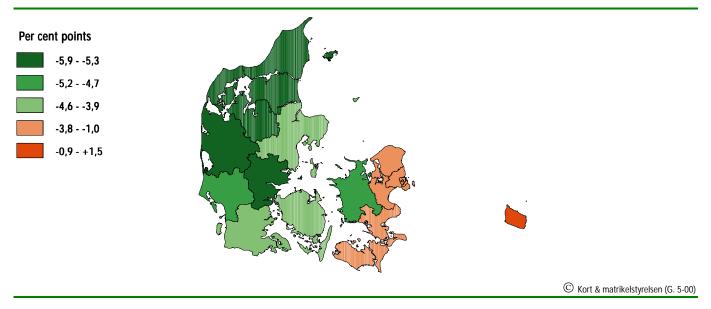

6 Statistical Yearbook 2000

The largest fall in unemployment in Jutland

The drop in unemployment from 1981 to 1999 has not been equal in all parts of the country. Figure 9 shows the fall in the rate of unemployment in different counties. It is clear that the drop in unemployment has been greatest in western Denmark. Bornholm County is the only county where unemployment has increased. The fall in unemployment has consistently been greatest in counties which started with the largest unemployment in 1981.

Figure 9

Changes in rate of unemployment from 1981-1999

6. Retirement

Unemployed retire later

The employed stop work, and the unemployed stop looking for work. In both cases people leave the labour force. Most will transfer to some form of pension scheme; early-retirement pension, transitional allowance, early-retirement pay, civil-servant pension, or state pension. Some die, and some emigrate, and thus also leave the labour force.

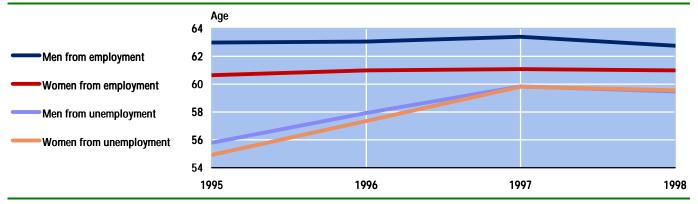

The following trend applies to all persons of 50 years and over who leave the labour force during a year. The average age of those who leave retire from employment in order to leave the labour force has remained almost constant at about 63 for men and 61 for women.

The average age for both men and women who transfer out of the labour force from unemployment has risen from 55-56 years old to 59-60 years old. A contributory factor to this increase is that transitional allowances which were granted to insured unemployed persons between 50 and 59 years old ceased from 31 December 1995.

Statistical Yearbook 2000 7

Figure 10

Average age for transfer from the labour force to being outside the labour force for persons of 50 years and above 1994-1998

Note. In contrast to previous analyses, temporary absence from the labour force on activation or leave schemes has not been included as retirement.

7. International comparisons

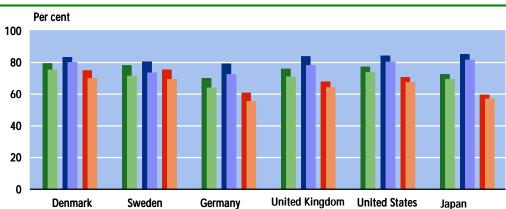

Denmark has the largest labour force

Comparison with Sweden, Germany, the USA, the UK, and Japan reveals that Denmark has the largest labour force. This is shown in a comparison of active employment between the six countries. By dividing the analysis between men and women, it can be seen that this is because of the high participation of women in business in Denmark. Women are more active in business in Denmark than in any of the five other countries, while the participation of men is less than the United Kingdom, the United States, and Japan (but more than Sweden and Germany).

Figure 11

Participation and employment rates in selected countries 1998

Note. Participation rate expresses the proportion of the population in the labour force, while the rate of employment is the proportion employed. In is all the countries, unemployment is calculated in labour-force surveys. The figures for unemployment and labour force therefore deviate from the register statistics.

Source: OECD Employment Outlook, June 1999.

The difference between the rate of employment and the participation rate arises because calculations of the rate of employment only include the employed, while calculations of participation rates are based on the whole labour force, i.e. including the unemployed. Large differences between

8

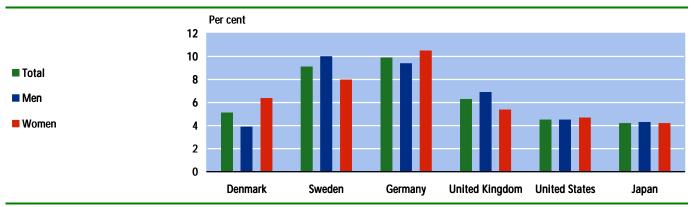

Labour market

participation and employment rates in individual countries therefore imply high rates of unemployment.

Relatively high unemployment amongst women in Denmark

Both figures 11 and 12 show that unemployment in 1998 was highest in Sweden and Germany, but it is clearer from figure 12 that there are differences between men and women. Denmark is the only country where unemployment for women is significantly more than unemployment for men. In both Germany and the USA, unemployment for women is slightly higher than for men, but the difference is not very large. In Sweden, the UK, and Japan unemployment for men is more than for women.

Figure 12 Unemployment rates in selected countries 1998

Note. See figure 11.
