¹ Refers to the lowest age. For example 50.01 years indicates the average life expectancy for a 20 year-old male in the mortality table 1993-1997. ² The figures indicate (per 10,000) the frequency of death between the two birthdays which are listed in the first column. ³ Average life time of a number of contemporaries who die according to the mortality table.

1994	59.7	130.0	136.6	97.3	53.1	17.3	0.8	2 474	1 280	1 110
1995	72.4	159.2	135.2	91.6	37.3	10.7	-	2 532	1 257	1 192
1996	80.1	154.5	129.8	85.5	37.0	11.0	-	2 490	1 231	1 168
1997	51.1	181.9	119.4	99.5	52.0	18.7	0.8	2 617	1 258	1 199
1998	47.4	161.4	105.2	82.3	64.0	14.9	3.5	2 393	1 146	1 076

Note: The age-related fertility rates which up until 1980 are calculated as the total average for each five-year age group as one, have been calculated as the simple average of rates for each one-year age group of women in child-bearing age. Calculation of fertility rates for 1981 based on these two methods indicate that results only differ slightly.

¹ The *net production rate* indicates the number of live girls 1,000 women in the child-bearing age (15 years to 49 years) would give birth to in the course of a five-year period if 1) from the age of 0 years, the death rate for the 1,000 women corresponds to the five-year death rate, and 2) the women in each age group give birth to exactly the same number of children as is listed in the five-year fertility rate.

DKK 600 000 +	214	249,4	1 358	569,1	1 572	818,5

Note 1. Full-year employment is calculated from the total number of taxable days divided by 365.

Note 2. Tax assessment is a technical tax unit where one person counts as one assessment and one person, while a married couple count as one assessment and two persons. The reason a married couple only counts as one assessment is that they are taxed together in Greenland. Therefore, a married couple only complete one tax return. Taxable income is calculated as full-year income, i.e. the total number of taxable days divided by 365.
